

# Contributing to the Examples

If you would like to contribute an example, please follow the easy steps below:

## Category

Please visit [Examples](#) and locate a suitable category. Click the category and move to the Example Headline section below.

If none exists you can make one with the following template:

```
<wrap headline-image>[[objects|{{examples:headline-objects.png|}}]]  
<span>Objects / Sprites</span></wrap>
```

objects

is the name of the path for your category, and is the actual link to your category page.

```
{{examples:headline-objects.png|}}
```

is the piece of code to use to bring in a suitable 180×100 pixel graphic to represent your category. This one will load headline-objects.png from the examples section. You can upload your own 180×100 image or choose from the ones available in the media manager. If you don't have an image, just use: examples:replace-me.png to use as a placeholder and someone will come along later and put a nice image on it.

```
<span>Objects / Sprites</span>
```

is the title of the category.

Save the page to see your new category. Which will look something like this:

Objects / Sprites

Click the category to go to your new page. Click create to make it for the first time.

## Category Page

This is the new category page. Add a major heading to show what category the user is in, for example:

===== Object Examples =====

## Example Headline

Create your new example link using the following format on the category page:

```
<wrap headline-image>[[examples:objects:create_object|{{examples:replace-me.png|}}]]
<span>Create Object</span></wrap>
```

Same deal, but take careful note on your new example page's link. The one above shown as:

```
examples:objects:create_object
```

This is the path to your new example page to create `create_object` under `examples/objects`.

Choose a good image and name of your example.

Save the page, and your link to your example will look something like this:

Create Object

Click the new link and go to your new page to create.

## Example

Create the page.

Use the following suggested format in order to show your example:

===== Create Object =====

===== Code =====

```
<code=c>
orxOBJECT *heroObject = orxObject_CreateFromConfig("HeroObject");
</code>
```

===== Config =====

```
<code=ini>
[HeroObject]
Graphic = HeroGraphic
```

```
Position = (320, 200, 0)
```

```
[HeroGraphic]  
Texture = hero.png  
</code>
```

And you're done!
