

# Setting up a Development Environment for Windows

Welcome to developing with Orx on the Windows operating system. These instructions will help you install the initial tools you need in order to work with Orx on your system.

This guide has been prepared on a fresh Windows 10 virtual machine in order to cover all the very basic requirements.

Only a few basic tools are required. These are:

1. GIT. [Git Bash](#) is recommended.
2. [Visual C++ runtime](#). This is required by Orx's setup tools. It may be very likely you already have this installed.

And that's it. Your windows system is ready to start developing with Orx.

Return to the [main page](#) to continue with cloning orx and building the orx library.
